Facebook's Graph API: The Future Of Semantic Web?

Posted by Dilip Krishnan on Apr 24, 2010

Community SOA Topics REST Tags Social Networking , Semantic Web , Facebook

Share

"There are two important themes behind everything we're delivering today," says Bret Taylor, head of Facebook's platform products [in the facebook developer blog](#), about the recent announcements at the f8 conference in San Francisco. Facebook introduced Open Graph protocol, and the Graph API as the next evolution in the Facebook platform.

First, the Web is moving to a model based on the connections between people and all the things they care about. Second, this connections-based Web is well on its way to being built and providing value to both users and developers — the underlying graph of connections just needs to be mapped in a way that makes it easy to use and interoperable.

Facebook introduced three new components of Facebook Platform two of which the Open Graph protocol, and the Graph API. The API provides access to Facebook objects like people, photos, events etc. and the connections between them like friends, tags, shared content etc. via a uniform and consistent URI to access the representation. Every object can be accessed using the the URL <https://graph.facebook.com/ID>, where ID stands for the unique ID for the object in the social graph. Every connection (CONNECTION_TYPE) that the facebook object supports can be examined using the URL https://graph.facebook.com/ID/CONNECTION_TYPE.

How Best Buy Is Using The Semantic Web

By RICHARD MACMANUS of ReadWriteWeb
Published: July 1, 2010

Yesterday we wrote about the increasing usage of [Semantic Web technologies by large commercial companies](#) like Facebook, Google and Best Buy. The [Semantic Web](#) is a Web of added meaning, which ultimately enables smarter and more personalized web apps to be built. In this post we explore how a leading U.S. retailer, [Best Buy](#), is using a Semantic Web markup language called RDFa to add semantics to its webpages.

[Technologies](#)

Myers told us that the primary goal of using semantic technologies was to increase the visibility of its products and services. And with data such as store name, address, store hours and GEO data being marked up using RDFa, search engines are now able to identify each of those data components more easily and put them into context.

This is not just an academic exercise for Best Buy. As we will see, semantic technology has already led to increased traffic and better service to its customers. We spoke to [Jay Myers](#), Lead Web Development Engineer at BestBuy.com, to find out how.

Semantic SEO for Google with GoodRelations and RDFa

Breaking News: Google has just announced that they now support the [GoodRelations vocabulary](#) developed by Prof. Hepp for Google Rich Snippets.

If you add a few extra lines to the HTML code of your Web site, you will feed Google and hundreds of evolving mobile and recommender applications in one turn.

On this page, we provide slightly modified markup that is superior to the [original Google pattern](#) for marking up your pages. Our recipe, developed by the inventor of GoodRelations for you personally, is understood by ALL RDFa-aware search engines, shopping comparison sites, and mobile services, while the Google recipe is perfect for Google only.

Principle and Effect

If you add a little bit of additional mark-up to your page, Google will use that information to substantially enhance the rendering of your page directly in the search results list.

There is preliminary evidence that search results with respective extensions get a **30 % higher click-through rate (CTR)**.

The flickering nature of search results in the new Google Instant technology will very likely further increase the gains of more appealing rendering in the results list. So don't put this off. **Act today!**

Google Snaps Up Metaweb in Semantic Web Play

Acquisition of firm offering a free, open source database of real-world information figures to inform smarter search as Google builds out semantic technology.

July 19, 2010
By Kenneth Corbin: [More stories by this author:](#)

Google's shopping spree doesn't show any signs of letting up, as the Web behemoth continues to open its wallet to acquire firms with niche technologies that can augment its developing business lines.

The latest target is Metaweb, a firm specializing in semantic Web technology that Google has acquired to improve its search engine. Specifically, Google thinks that Metaweb's database of real-world items can help it produce ordered and accurate results in response to specific, complex search queries. DevX has the details.

In the latest in a string of acquisitions, Google has unveiled plans to purchase Metaweb, a firm that maintains a vast open source database of information about objects in the real world.

Through the acquisition, Google (NASDAQ: GOOG) aims to provide a smarter search engine that will be able to retrieve more specific answers to complex queries.

Google, Twitter and Facebook build the semantic web

› 02 August 2010 by [Jim Giles](#)

› Magazine issue 2771. [Subscribe and save](#)

A TRULY meaningful way of interacting with the web may finally be here, and it is called the [semantic web](#). The idea was proposed over a decade ago by Tim Berners-Lee, among others. Now a triumvirate of internet heavyweights - Google, Twitter and Facebook - are making it real.

The defining characteristic of the semantic web is that information should be stored in a machine-readable format. Crucially, that would allow computers to handle information in ways we would find more useful, because they would be processing the concepts within documents rather than just the documents themselves.

Imagine bookmarking a story about Barack Obama: your computer will store the URL, but it has no way of knowing whether the content relates to politics or, say, cookery. If, however, each web page were to be tagged with information about its content, we can ask the web questions and expect sensible answers.

...

- What is different now?
 - Semantics in Search
 - Advertising drives Web markets
 - “Buzz” around data on the Web
 - Facebook OGP, Open Govt Data, ...
- Maturation of RDF technologies
 - SPARQL endpoints
 - RDFa
 - Lightweight Knowledge
 - A little semantics goes a long way

Friend of a Friend
(our former favorite example)
Tetherless World Constellation

- FOAF
 - >60M Foaf people (not necessarily distinct individuals) in hundreds of applications touched by a large community (> 100,000,000 users)
 - Used by a number of large providers
 - If you use LiveJournal, you have a FOAF file
 - Also flickr, ecademy, tribe, joost, ...
 - And you can export Foaf from Facebook and many other social networking sites

FOAF Network has been
explored as Social network *per se*
Tetherless World Constellation

Foaf complicated compared to OGP (Facebook's Open Graph Protocol)

Tetherless World Constellation

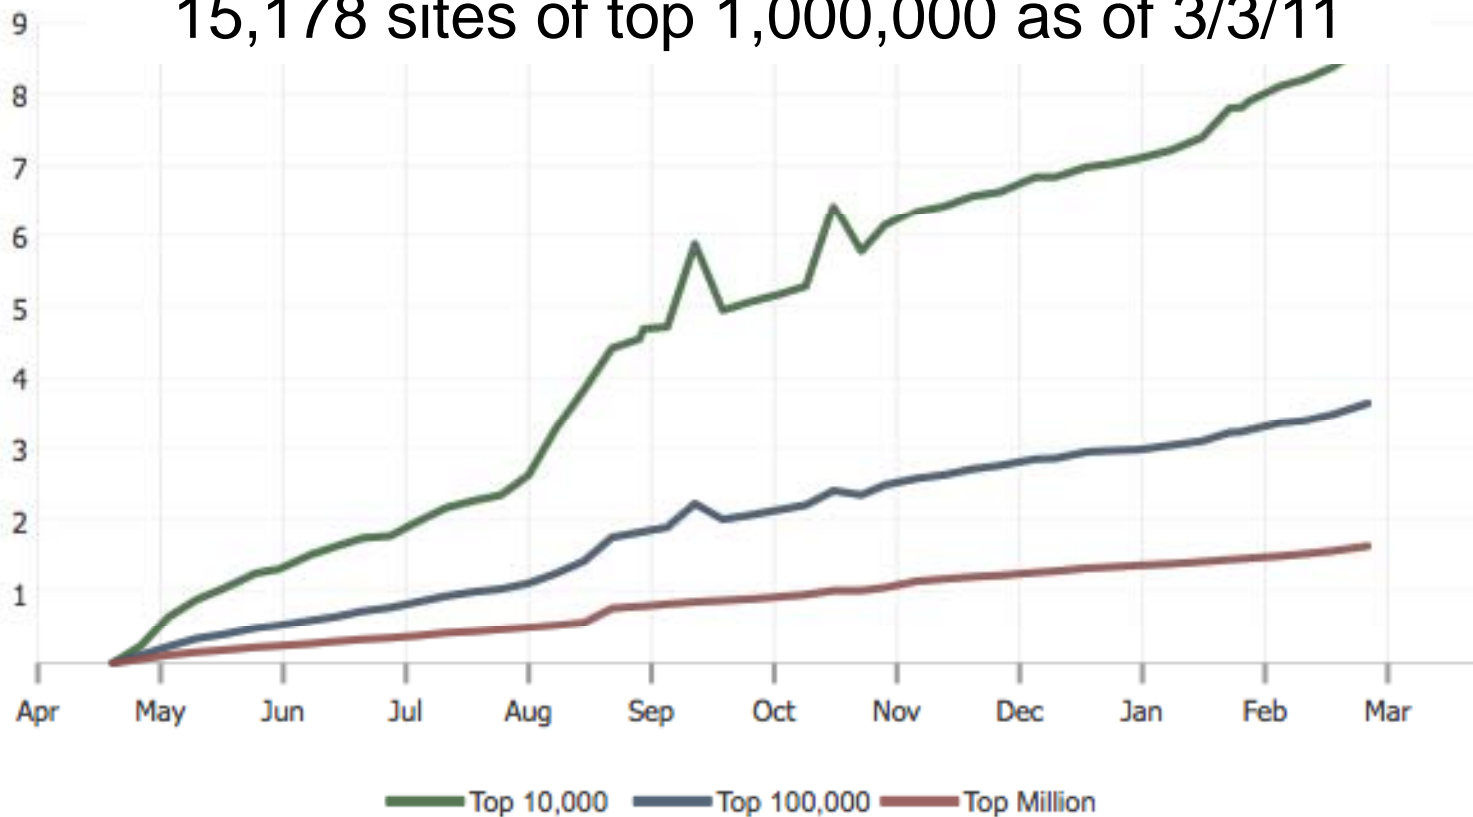

- og:title - The title of your object as it should appear within the graph, e.g., "The Rock".
- og:type - The type of your object, e.g., "movie". Depending on the type you specify, other properties may also be required.
- og:image - An image URL which should represent your object within the graph.
- og:url - The canonical URL of your object that will be used as its permanent ID in the graph
- og:description - A one to two sentence description of your object.
- og:site_name - If your object is part of a larger web site, the name which should be displayed for the overall site. e.g., "IMDb".

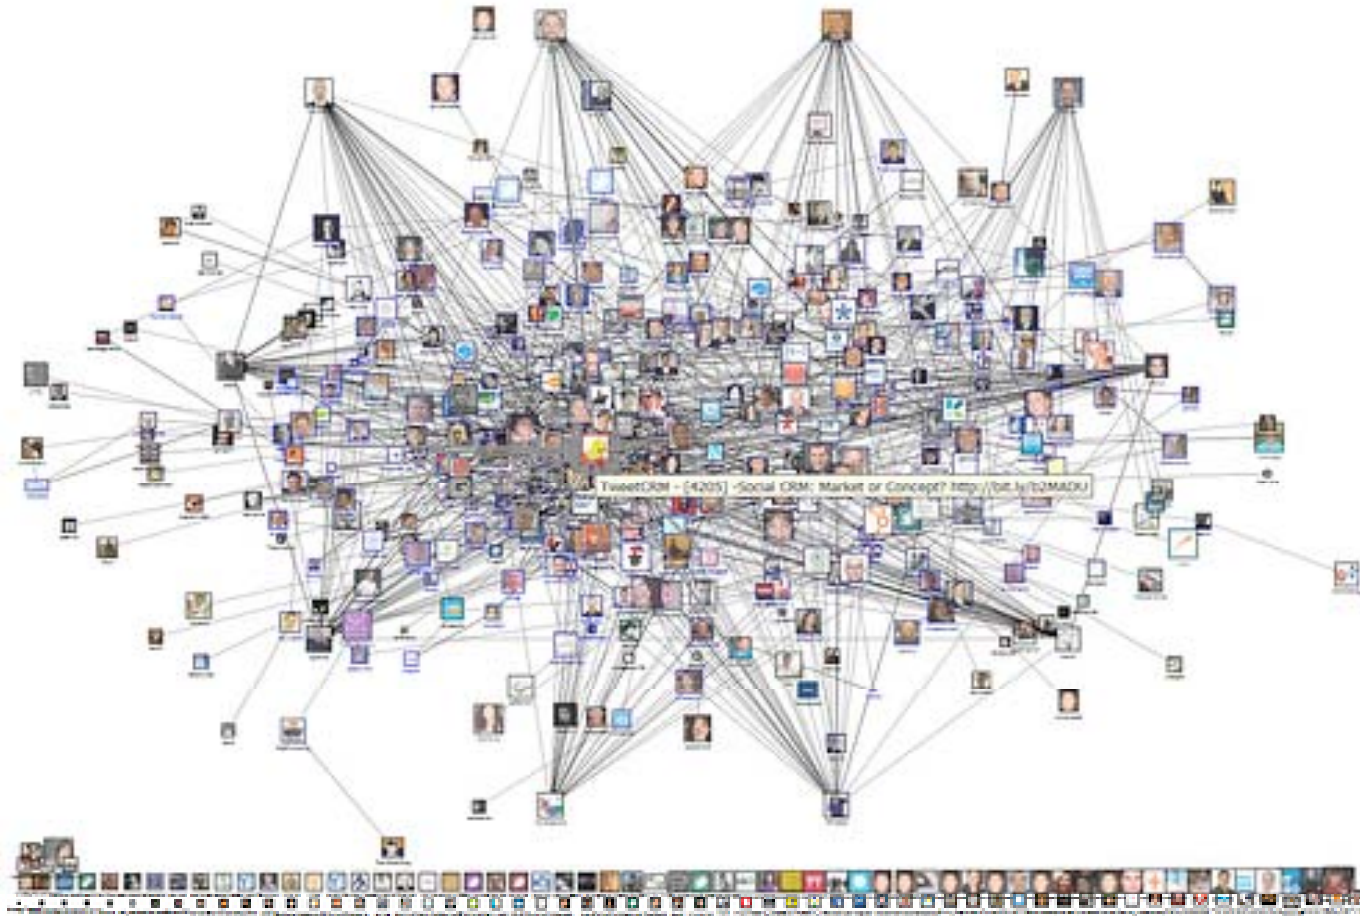

OGP use growing quickly
Facebook incentivizing use of RDFa like buttons
Tetherless World Constellation

15,178 sites of top 1,000,000 as of 3/3/11

OGP creates a fast-growing,
multiply-labeled, network
